

Datria's Innovative Voice Technology

How It Works for You

[Click Here](#) to Learn About Datria's Integrated Configuration Environment (DICE)

The Datria Voice Architecture (DVA) Platform

The Most Open and Flexibly Voice Architecture Available Today

We've developed our solutions to focus on providing you with choices and flexibility in how you deploy and integrate voice with your existing infrastructure. You should have a choice in how you deploy voice for your enterprise without compromise or added costs.

Standards-Based - We created a strong software foundation that utilizes today's most innovative and powerful development technologies, including J2EE, XML, VoiceXML, Web Services and SOAP. By building these into our applications and framework we can more easily and effectively deliver the benefits of voice while minimizing your total-cost-of-ownership.

Packaged Voice Applications - From deploying voice directed picking in the warehouse to mobile field service ticket management, Datria has built a library of voice applications that let you start saving today.

It's About the VUI, Not The GUI - Datria's solutions understand the context the technician is working in and ask questions that are appropriate to the situation. We believe it's about the Voice User Interface, not assuming you rely on the old Graphical User Interfaces of the technology you're replacing.

You don't need to change your existing software to use a Datria solution. Our flexible and innovative technology can interface to any systems you utilize to manage your warehouse, your store operations, your manufacturing facility, your delivery drivers, or your field service operators/technicians. Datria makes the software you already have more valuable - we connect it in real-time to your workforce.
